SEE THE SYSTEM

Wardley mapping, one click at a time. DDD Belgium workshop, 20 October 2026.

> **The question for tonight**
>
> Harbour Insurance gave every product team AI coding agents. Code now arrives in hours, not days. Yet customers get new features no faster than before. Management asks: we pay for AI coding agents, but we don't see faster delivery. What is happening?

The evening

TALK	THEN, IN YOUR GROUP
01 Cup of tea	Exercise 1 · Who needs what? Exercise 2 · Build the chain
02 Evolution: the map wakes up	Exercise 3 · Spread it out
03 Tea shop at rush hour	Exercise 4A · Find the constraint Exercise 4B · Draw three pipelines
04 Strategy and the OODA loop Knowledge architecture	Exercise 5 · Simplify and move
05 A real map: EM tooling	Event modeling tooling map

Four people, four roles

Domain expert	Knows the company. Has the final word and decides.
Facilitator	Starts the talk and makes sure everyone is heard.
Timekeeper	Keeps time and keeps the group moving.
Clerk	Handles the materials and the canvas, writes down the questions and the decisions, and brings questions to CJ.

Work one, two, four: think alone, then in pairs, then as four. Feel free to swap roles after each exercise.

Harbour Insurance and the six steps

- Harbour Insurance insures ships, cargo and the businesses around the port of Antwerp.
- It has about 2,000 employees and 300,000 policies. Quotes, policies and claims all run through its own software.
- The product and engineering organisation has 6 product teams, about 40 developers and one architect.
- **Purpose:** get new insurance products and changes to customers quickly and safely.
- **Scope for today:** from a product hypothesis to customers using the change.

Six steps to a Wardley map

STEP	QUESTION	EXERCISE
1 Purpose	Why are we mapping?	1
2 Scope	What is in, and what is out?	1
3 Users	Who is it for?	1
4 User needs	What do they need?	1
5 Value chain	What do the needs depend on?	2
6 Map	Where does each component sit on the evolution axis?	3

The Wardley Mapping Canvas, designed by Ben Mosior, with the evolution cheat sheet by Simon Wardley. CC BY-SA 4.0. hiredthought.com/wardley-mapping

Exercise 1: who needs what?

Tonight we map an internal value chain, not the insurance marketplace: how Harbour Insurance delivers change. Its users are the people who make change happen. Write the purpose and the scope first. Then name the users of the delivery system and, under each user, their needs in their own words. Stop there: the value chain comes in Exercise 2.

1 PURPOSE

2 SCOPE: IN AND OUT

3 USER

4 THEIR NEEDS

3 USER

4 THEIR NEEDS

3 USER

4 THEIR NEEDS

3 USER

4 THEIR NEEDS

3 USER

4 THEIR NEEDS

3 USER

4 THEIR NEEDS

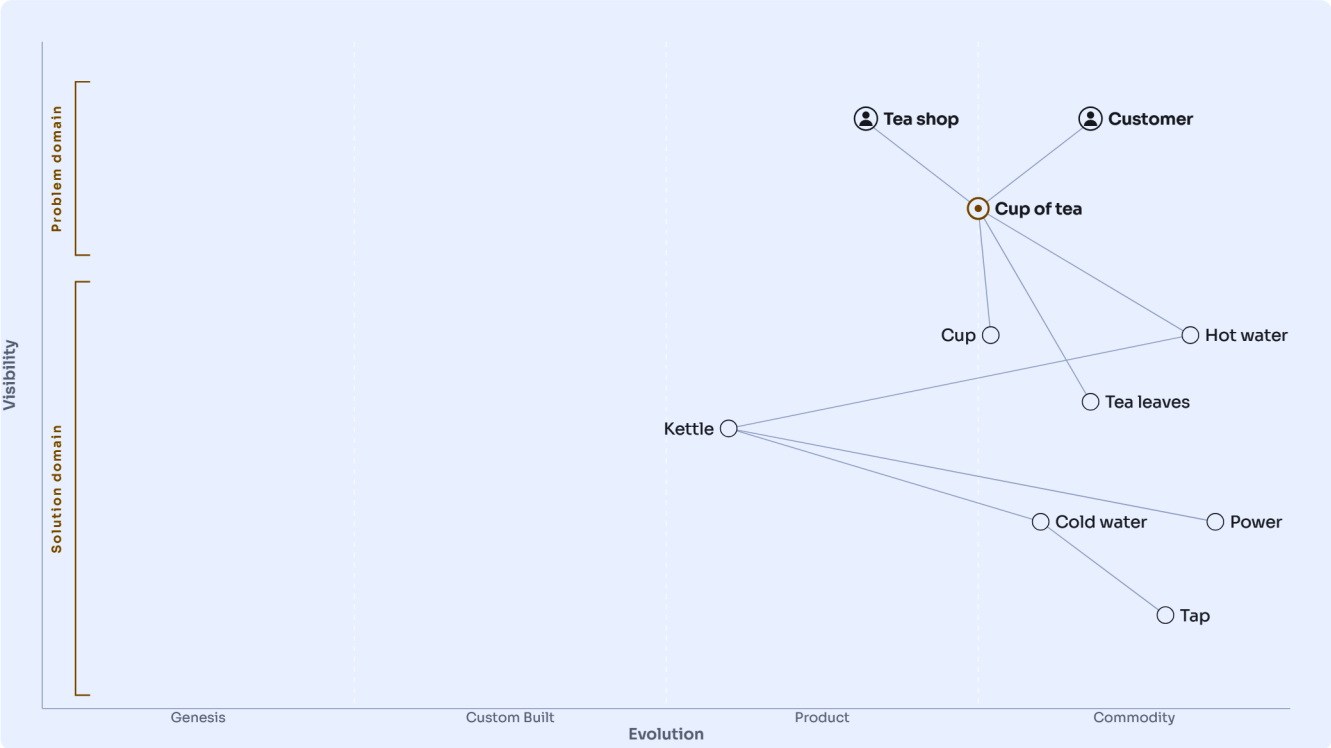

Before Exercise 2: pick your anchor

To build one map, you need one anchor. Ask what question the map answers. For Harbour Insurance it is "Why is delivery slow?" Pick the user whose need matters for that question. The other needs become components in your chain.

THE QUESTION THIS MAP ANSWERS

ANCHOR USER AND THEIR NEED

How to read a Wardley map

The cup of tea: a customer needs a cup of tea, which needs tea leaves, hot water, a kettle and power.

Reading the value chain

- Components near the top are visible to the user. Components near the bottom are hidden from the user.
- Read down to ask how: how is this need met?
- Read up to ask why: why do we need this?
- Each link is a dependency. The component above pays money or effort, and gets a capability back.
- A map is a chain of needs.

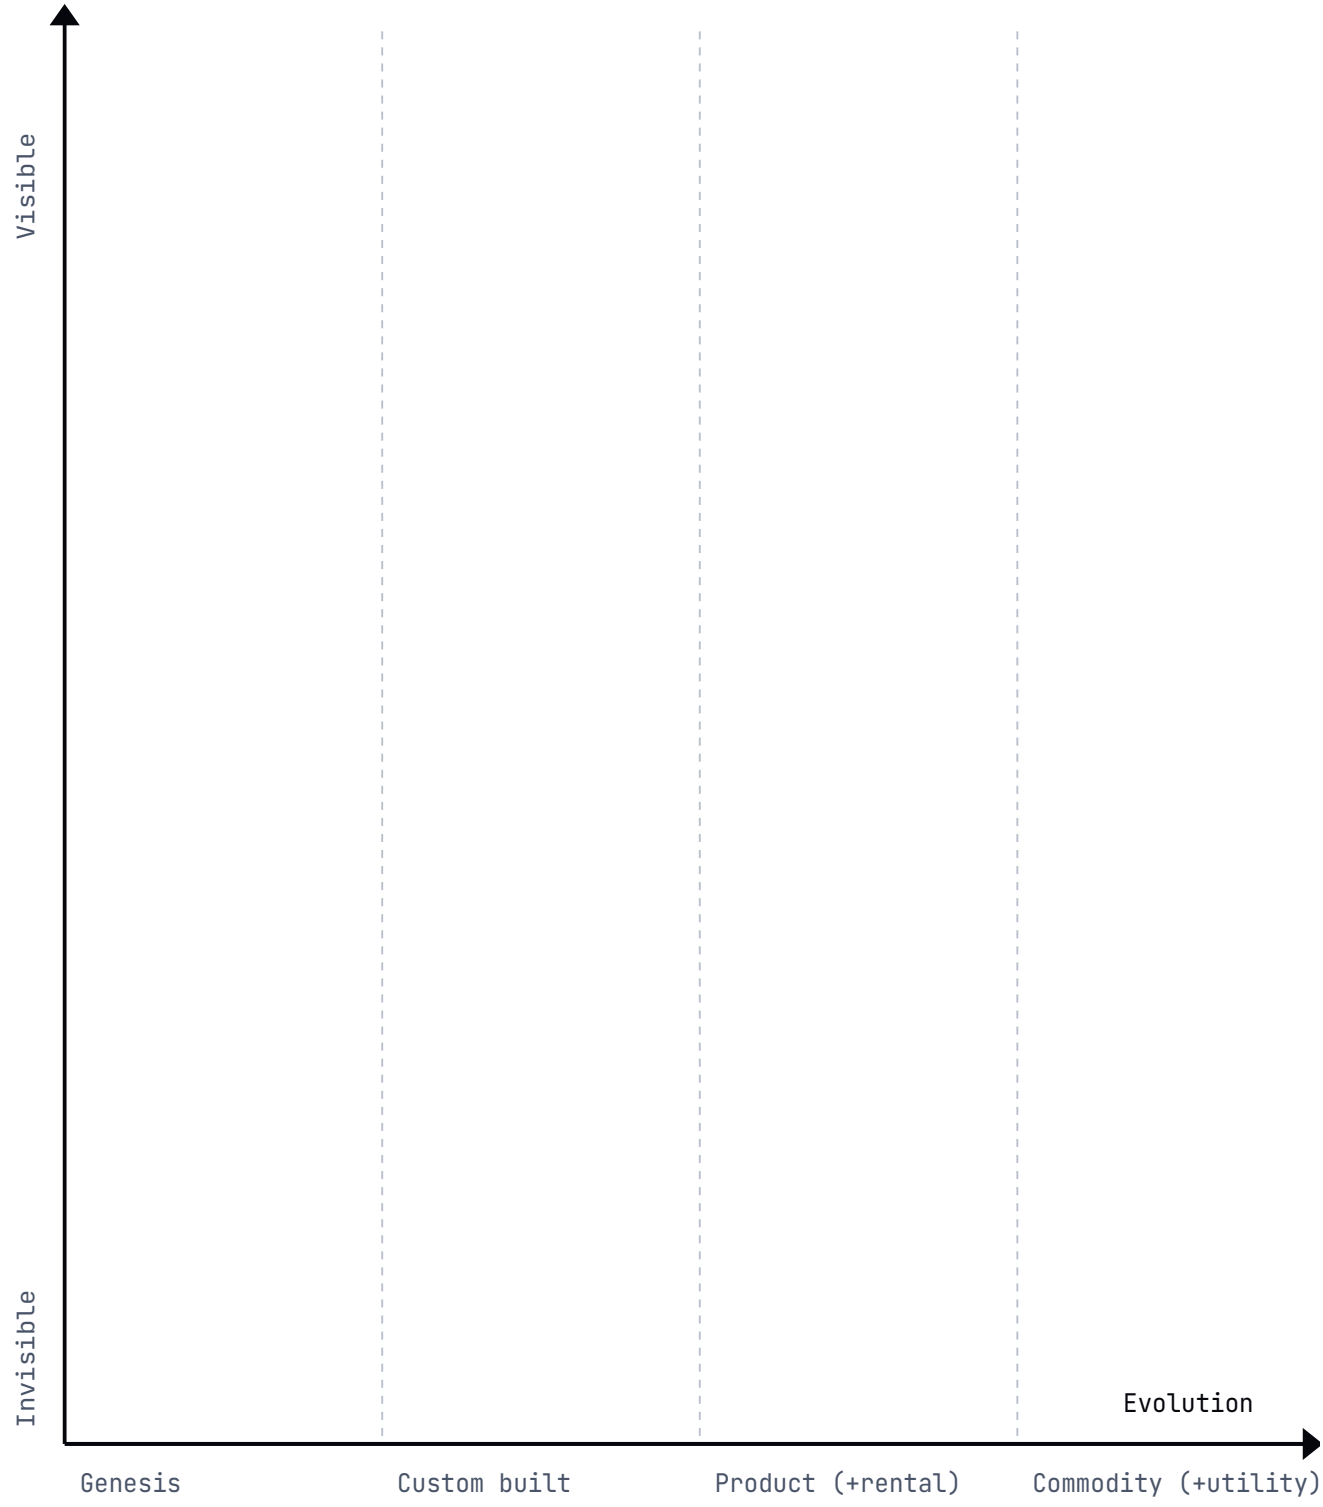

What goes on a map

- Activities: what we do. Making a cup of tea.
- Practices: how we do it. Hand brewing.
- Data: facts we keep. The menu and the prices.
- Knowledge: what we understand. How strong tea should be.
- Things we use: the cup, the kettle.

Exercises 2 and 3: build the chain, then spread it out

Exercise 2. Start from your anchor and its need. Ask "what does this depend on?" until you reach infrastructure. Stack the components by visibility, most visible at the top. Do not place them on the evolution axis yet.

Exercise 3. Take your chain and place every component on the evolution axis: genesis, custom built, product, commodity. Users and needs stay at the top. If you are stuck on a placement, the domain expert decides.

Everything evolves, and the way we work should follow

Every component evolves from left to right through supply and demand competition. You cannot stop it. You can only speed it up or slow it down.

Evolution: four sets of stage labels

	I	II	III	IV
Activities	Genesis	Custom built	Product (+rental)	Commodity (+utility)
Practices	Novel	Emerging	Good	Best
Data	Unmodelled	Divergent	Convergent	Modelled
Knowledge	Concept	Hypothesis	Theory	Accepted

Practices evolve with the activity. When servers became a utility, autoscaling replaced capacity planning. Code is now close to a commodity, so code review will have to evolve too.

Doctrine: use appropriate methods

One way of working does not fit the whole map. Pick the way of working by the stage each component sits in, not by habit.

	GENESIS, CUSTOM BUILT	PRODUCT	COMMODITY, UTILITY
The goal	Learn fast	Get it right	Cut cost and variation
How we work	Agile: small experiments	Lean: improve the flow	Six Sigma: standardise and automate
How we get it	Build it ourselves	Buy it and fit it in	Rent it as a utility
At Harbour Insurance	The product hypothesis	Event model tooling	AI coding agents, CI

Where work waits, and the several ways to do one thing

Constraint and inertia

- A constraint is a capacity limit. Work piles up in front of it.
- Inertia is when the old way is kept although a better one exists.
- To find inertia, ask who would lose if the component moved.

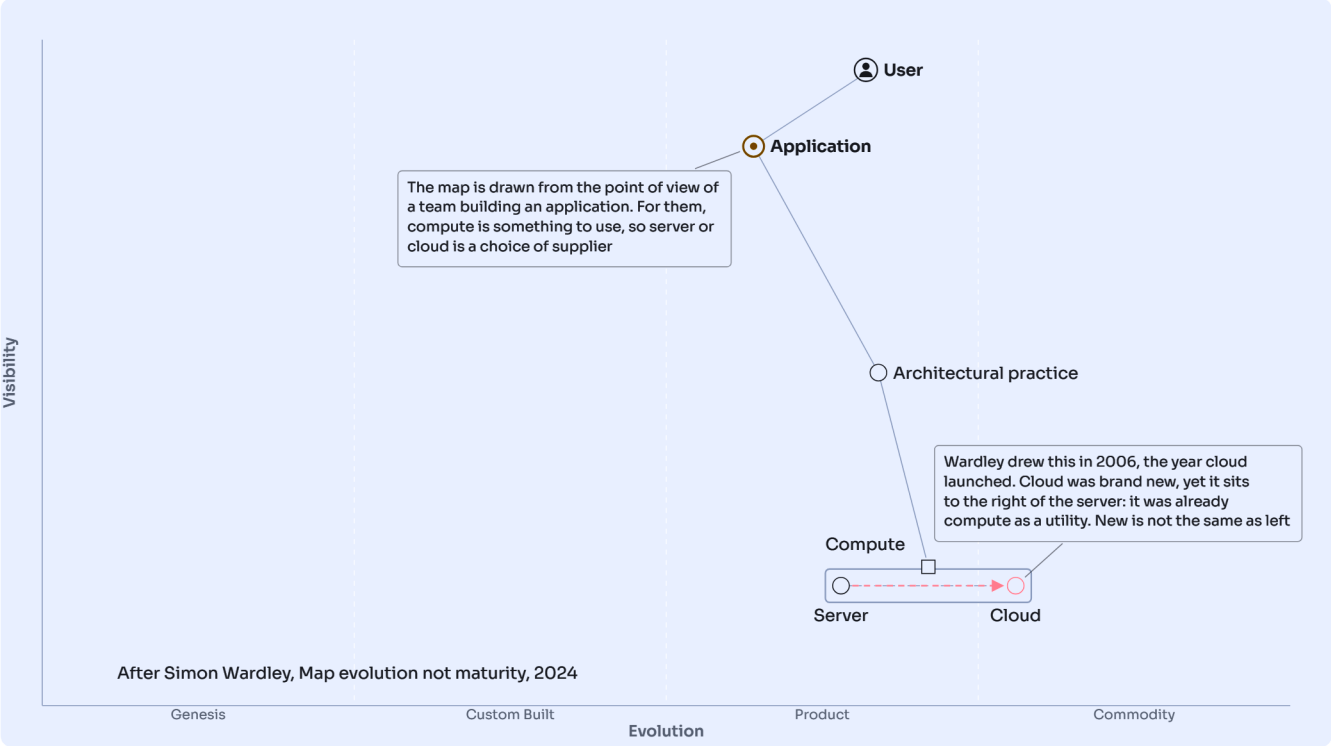

Goldratt's five steps

1. Identify the constraint.
2. Exploit it: get the most out of what is already there.
3. Subordinate everything else to it.
4. Elevate it: add capacity, and only now.
5. Repeat: the constraint has moved.

A pipeline, in Simon Wardley's sense

A pipeline is one component that is done in several ways at the same time, each way at its own stage of evolution. You draw it as a box along the evolution axis with each way inside it. A new invention starts on the left. The industrialised form of an old activity goes on the right, however new it is. If people move from one way to another, draw an arrow.

This is not a delivery pipeline. Build, test and release are steps that work passes through. A Wardley pipeline holds different ways of doing the same thing.

Compute as a pipeline, redrawn after Simon Wardley's "Map evolution not maturity": server and cloud side by side, with people moving from server to cloud.

Exercise 4: find the constraint, draw three pipelines

4A · Find the constraint

THE CONSTRAINT: WHERE DOES WORK WAIT LONGEST?

ONE INERTIA: WHAT RESISTS CHANGE, AND WHO WOULD LOSE IF IT MOVED?

EXPLOIT, WITH NO BUDGET	SUBORDINATE THE REST	ELEVATE: WHAT TO INVEST IN

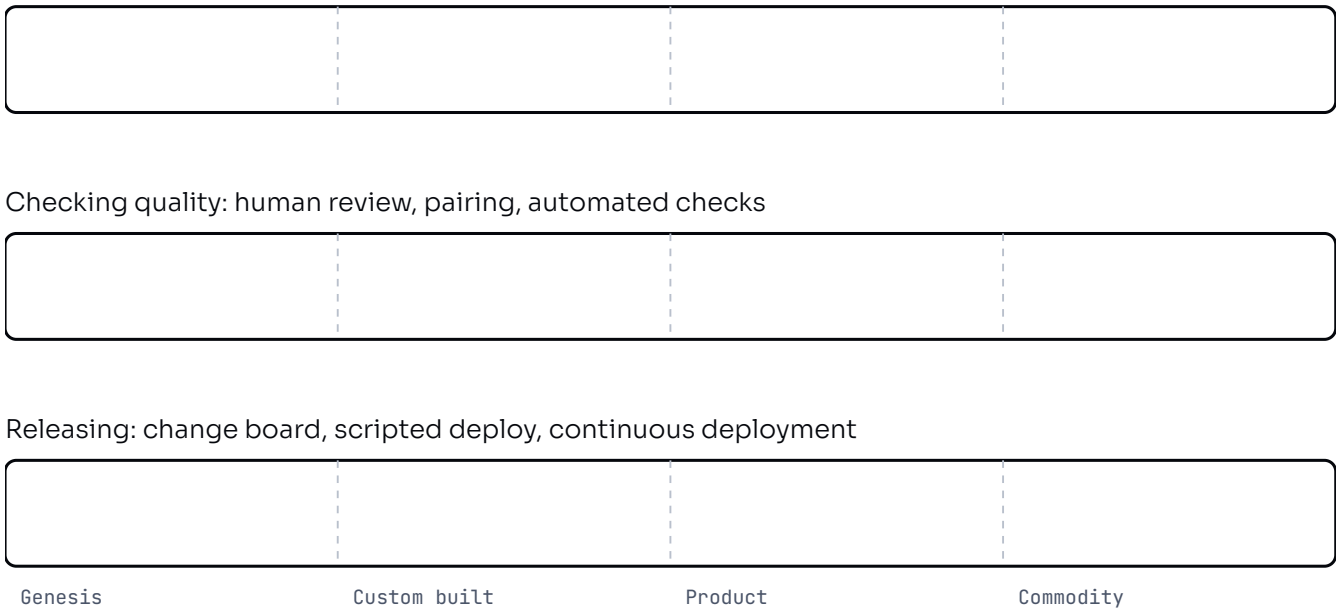

4B · Draw three pipelines

Place each way at its own stage of evolution. Then ask: which pipeline moved right, and which one holds the constraint?

Writing code: by hand, with an AI assistant, by AI agents

Checking quality: human review, pairing, automated checks

Releasing: change board, scripted deploy, continuous deployment

Exercise 5: simplify and move

First: cut it down

Write the question your map answers. Remove what does not change the answer. Aim for 12 components or fewer.

Four ways to make a map readable

- One question per map: keep what changes the answer.
- One map per user, when their needs really differ.
- Map around the constraint: the chain to it, nothing else.
- Fold a cluster into a submap.

Then: make a move

Draw one strategic move on your simplified map. Use a dashed arrow for natural evolution and a solid arrow for a move you intend. Pick a gameplay pattern that speeds it up or holds it back.

Gameplay: moves you can choose

- Open approaches: commoditise a layer someone else owns.
- Innovate, leverage, commoditise.
- Standards game: set the rules others build on.
- Exploit inertia: move where a rival cannot follow.
- Co-creation: build it with users, not for them.

Last: the travelling map

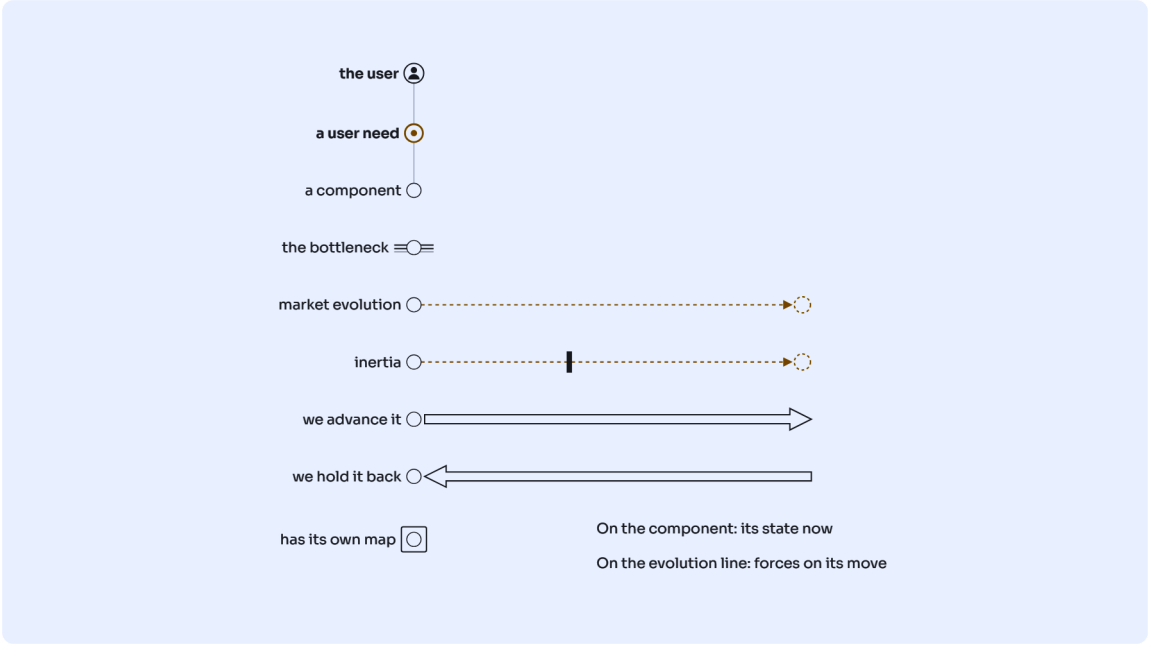

Two of you take your map to the group with the next higher card. The group with the highest card goes to the lowest. Explain your question, your map and your move. The hosts ask what you left out and whether you would dare that move. Then swap. About 10 minutes.

THE QUESTION OUR MAP ANSWERS

WHAT WE CUT, AND WHY

OUR MOVE, THE PATTERN WE CHOSE, WHO GAINS AND WHO LOSES

The legend, and where to read on
